

Use Case: Create Plan of Classes

Main Flow

1. The user selects "Create Plan" from the main menu.
2. The system shows the list of classes available for him to enrol in **during the next week**, indicating the **name**, **price**, **type of items to be used**, **day** and **time**.
3. The user selects the classes to be enrolled that are included in the planning updating the total price depending on the number of classes and the price for enrolling into them.
4. The user selects create plan if there is at least one class selected for being enrolled.
5. The system shows the classes selected indicating their **name**, **type**, **price**, **day and time** and requests the user to provide a **name** (mandatory) for the planning, a **description** (optional), how many **weeks** (mandatory) he is planning to attend, and his **health issues (optional)** as well as the **goals (optional)** he hopes to achieve for each class, and select which of his **payment methods** (mandatory) wants to use.
6. The user fills in such data and chooses the Save option.
7. The system shows the **plan** performed, indicating user's data (Name and Surname), when the plan was made, its total price, name, description, number of weeks, and health issues, as well as the classes enrolled in (name, type, price, date, time and goals).

Alternative flow 0 - to step 2

If the system detects that there are no classes available, it will warn the user.

Alternative flow 1 - to step 2

2.1 The system offers the user the alternative to filter the classes according to their type and/or date.

2.2 The user selects those filters he is interested in.

2.3 The system shows those classes that satisfied only the selected filters.

Alternative flow 2 - to step 2

If the system detects that the user has selected a date of the enrolment before than today it will warn the user and will return to step 2.

Alternative flow 3 - to step 5

The user selects to modify the plan returning to step 2.

Alternative flow 4- to step 7

If the system detects there are not classes selected, then the create plan option to continue the process won't be available.

Alternative flow 5 - to step 7

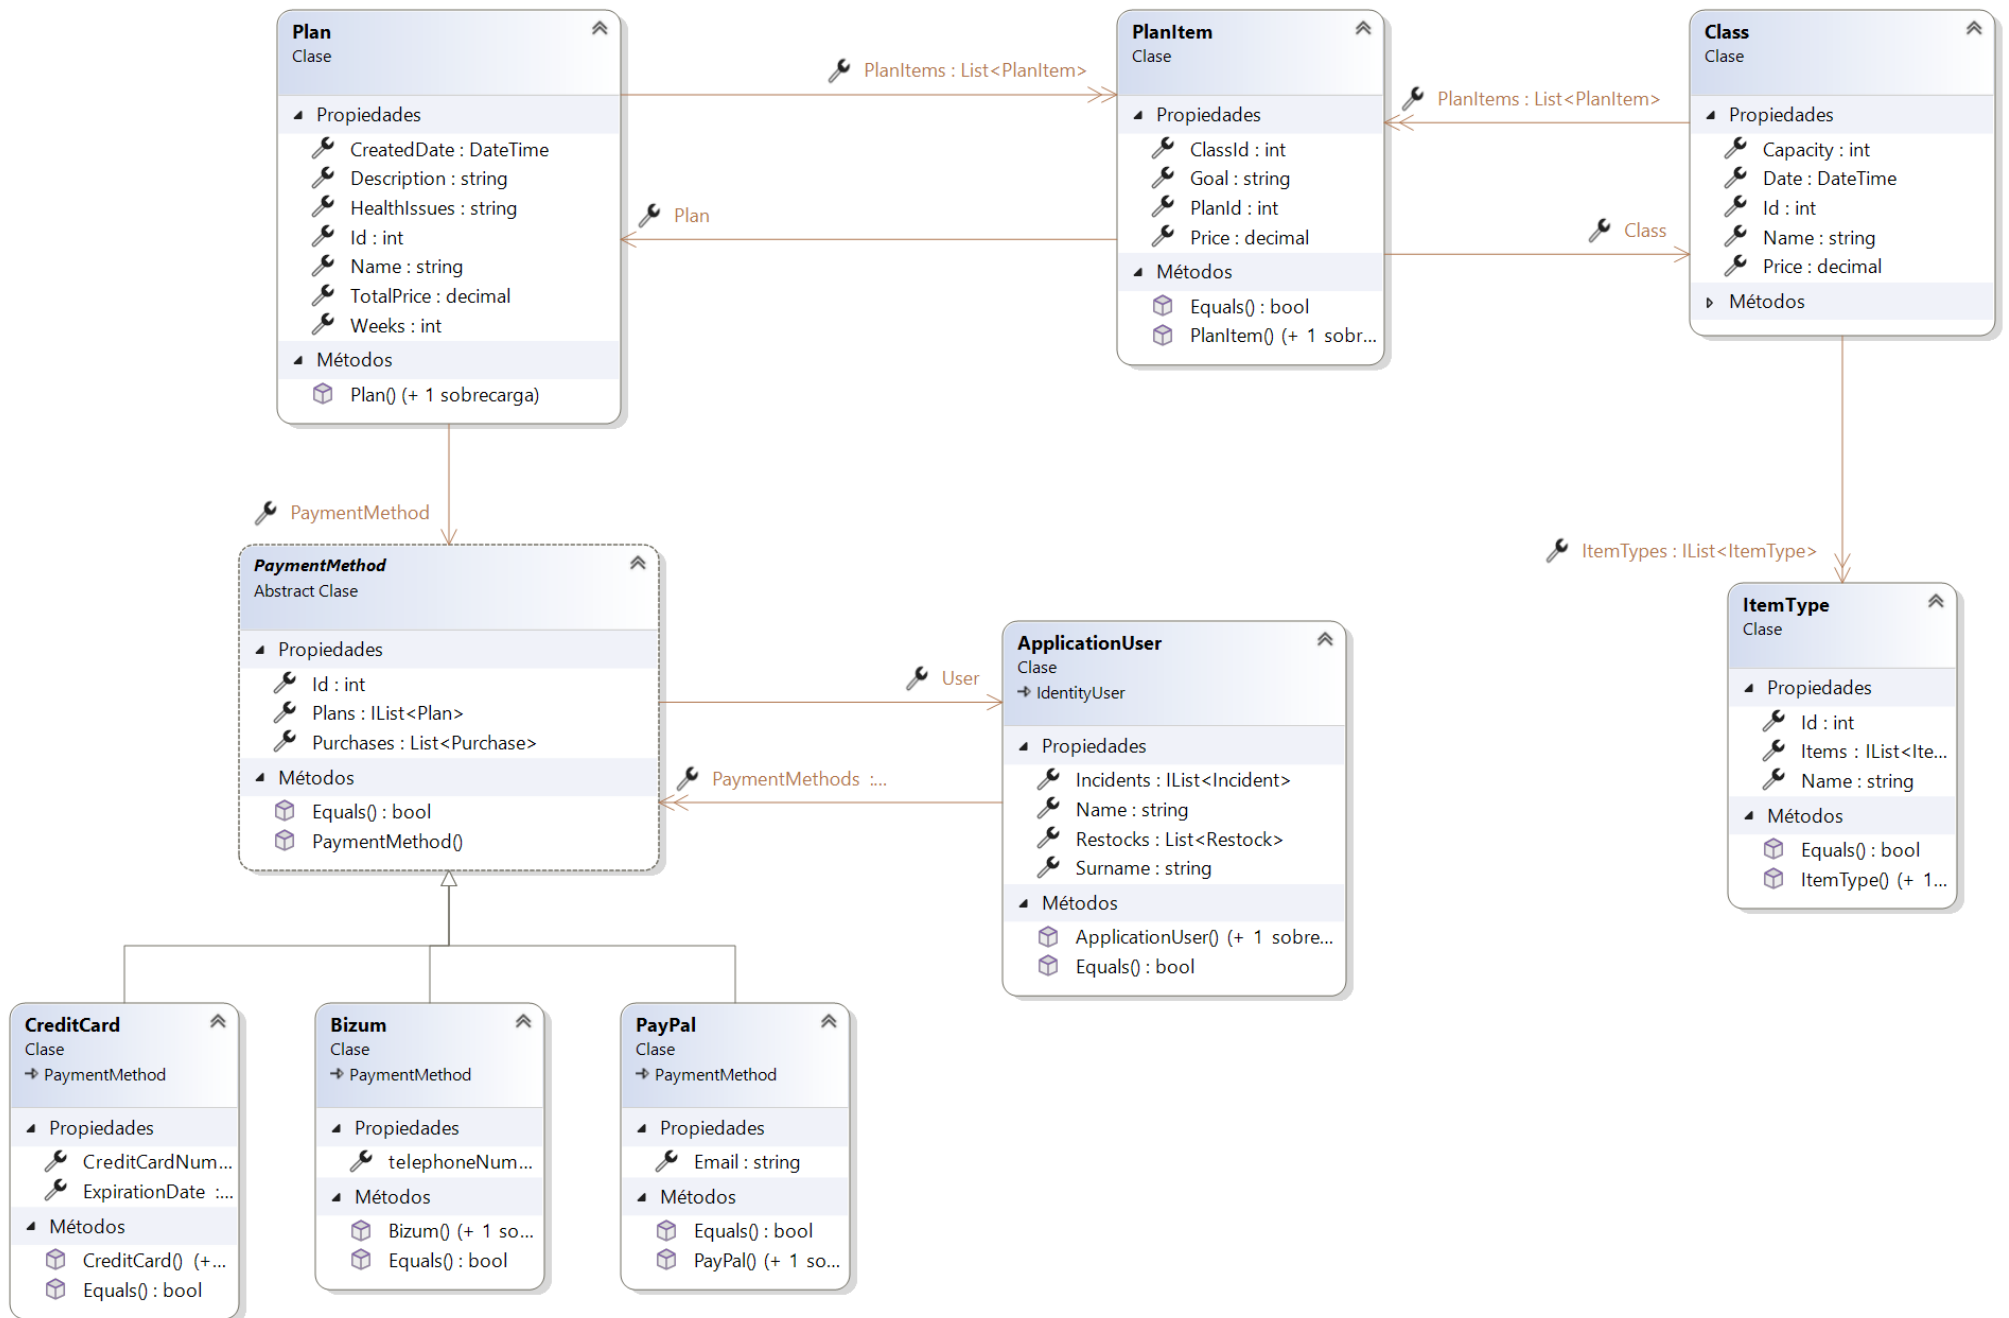

If the system detects that any mandatory data have not been filled, the system will notify it to the user and return to step 5.

Alternative flow 7 - to step 7

The system will warn the user if any class has not enough capacity, returning to step 2 to modify the selected classes.

Pre-condition

The ApplicationUser is logged-in with role User.

Use Case: Report Incident with Items for Exercise

Main flow:

1. The user selects the “Report Incident with Items for exercise” option from the menu.
2. The system displays a list of all the items in the gym and their information (name, type, location, and description of the item).
3. The user selects at least one or more affected items and clicks the “Next” button.
4. The system shows the selected items’ information (name, type, location, description) and requests the user to provide a title for the incident, when this was detected, which exercise he was doing (all mandatory), and to select a priority level (mandatory) and a description (optional) for each item.
5. The user fills in the data and clicks the “Submit Incident” button.
6. The system shows a message indicating that the incident has been reported and its state is submitted, the details of the incident (title given, date of the incident, the exercise, and name of the reporter) as well as for the affected items their information (name, type, location, description of the item, given priority level).

Alternative flow 1 — to step 2:

If there aren’t any available items or all of them have some pending incident, the system notifies the user and prompts them to return to the main menu.

Alternative flow 2 — to step 2:

- 1.1. The system provides the user with the option to filter this list by name or location.
- 1.2. The user selects the criterium to use to order the list.
- 1.3. The system displays the list again, now sorted according to the user’s selection.

Alternative flow 3 — to step 4:

If the user hasn’t selected any items, the system returns to step 2 and requests the user to select at least one item to continue.

Alternative flow 4 — to step 5:

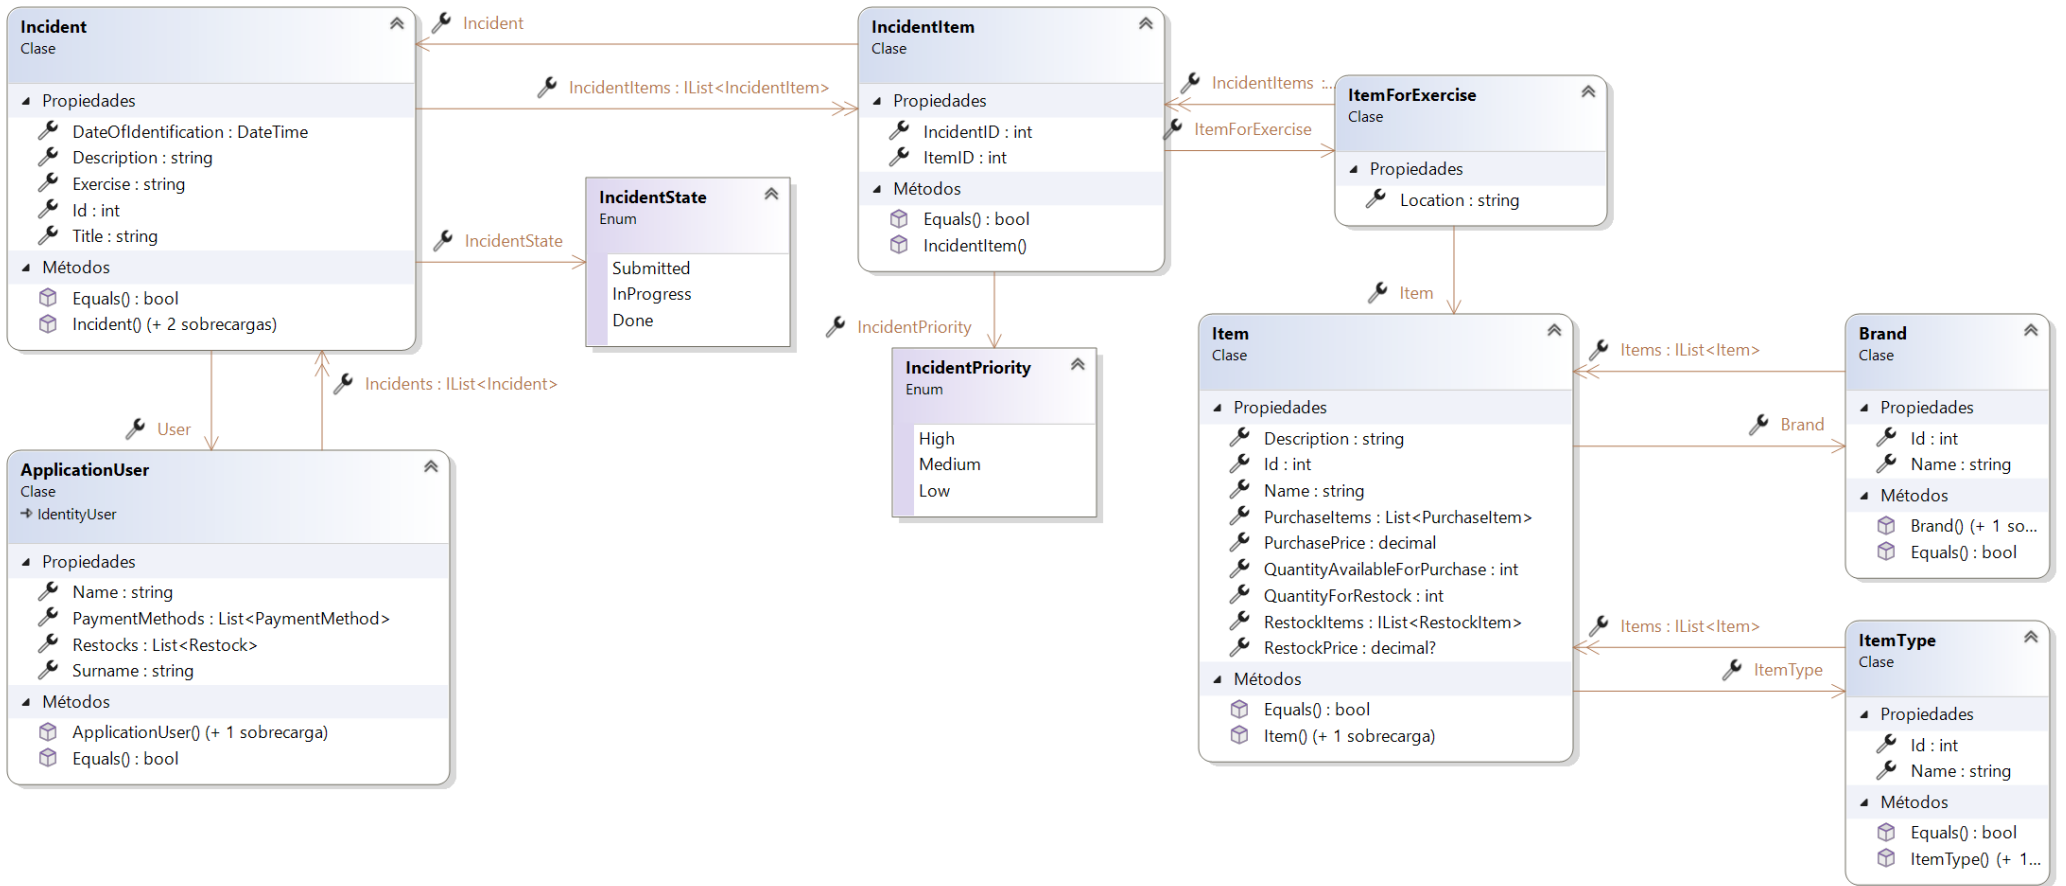

The user selects to modify the list of selected items returning the system to step 2.

Alternative flow 5 — to step 6:

If the mandatory data are not filled in, the system informs the user and returns to step 4.

Pre-condition

The ApplicationUser is logged-in with role User.

Use Case: Purchase items

Main Flow:

1. The user clicks on the “Shop” tab from the home menu.
2. The system shows a list of items that are available to be purchased, each one with **name, brand, description, price and quantity available for purchase**.
3. The user selects the desired item/s and clicks on “Buy”.
4. The system will show the selected items detailing their **name, quantity, brand, price and description**.
5. The system requests the user to select which of her **payment methods** wants to use, the **address** (street, city and country) for the purchase to be delivered, an optional **description for the purchase** and the **quantity** of each of the selected items to be bought (mandatory).
6. The user fills the requested information and clicks “Continue”.
7. The purchase is now completed, and the system will show the details for that purchase **delivery_address** and **total_price, description, payment method** as well as **name, brand, quantity and price** for each item purchased.

Alternative flow 1 - to step 2

The system will show an error message if there are no items available to purchase will go back to the Home tab.

Alternative flow 2 - to step 2

- 2.1 The system will provide the user with a tool to filter any product according to the **name** and **brand**.
- 2.2 The user selects the desired filters (they can filter any item by its **name** and **brand**) in order to find the items.
- 2.3 The system shows the items that match the user filters.

Alternative flow 3 - to step 4

The user presses come back to modify the shopping cart.

Alternative flow 4 - to step 7

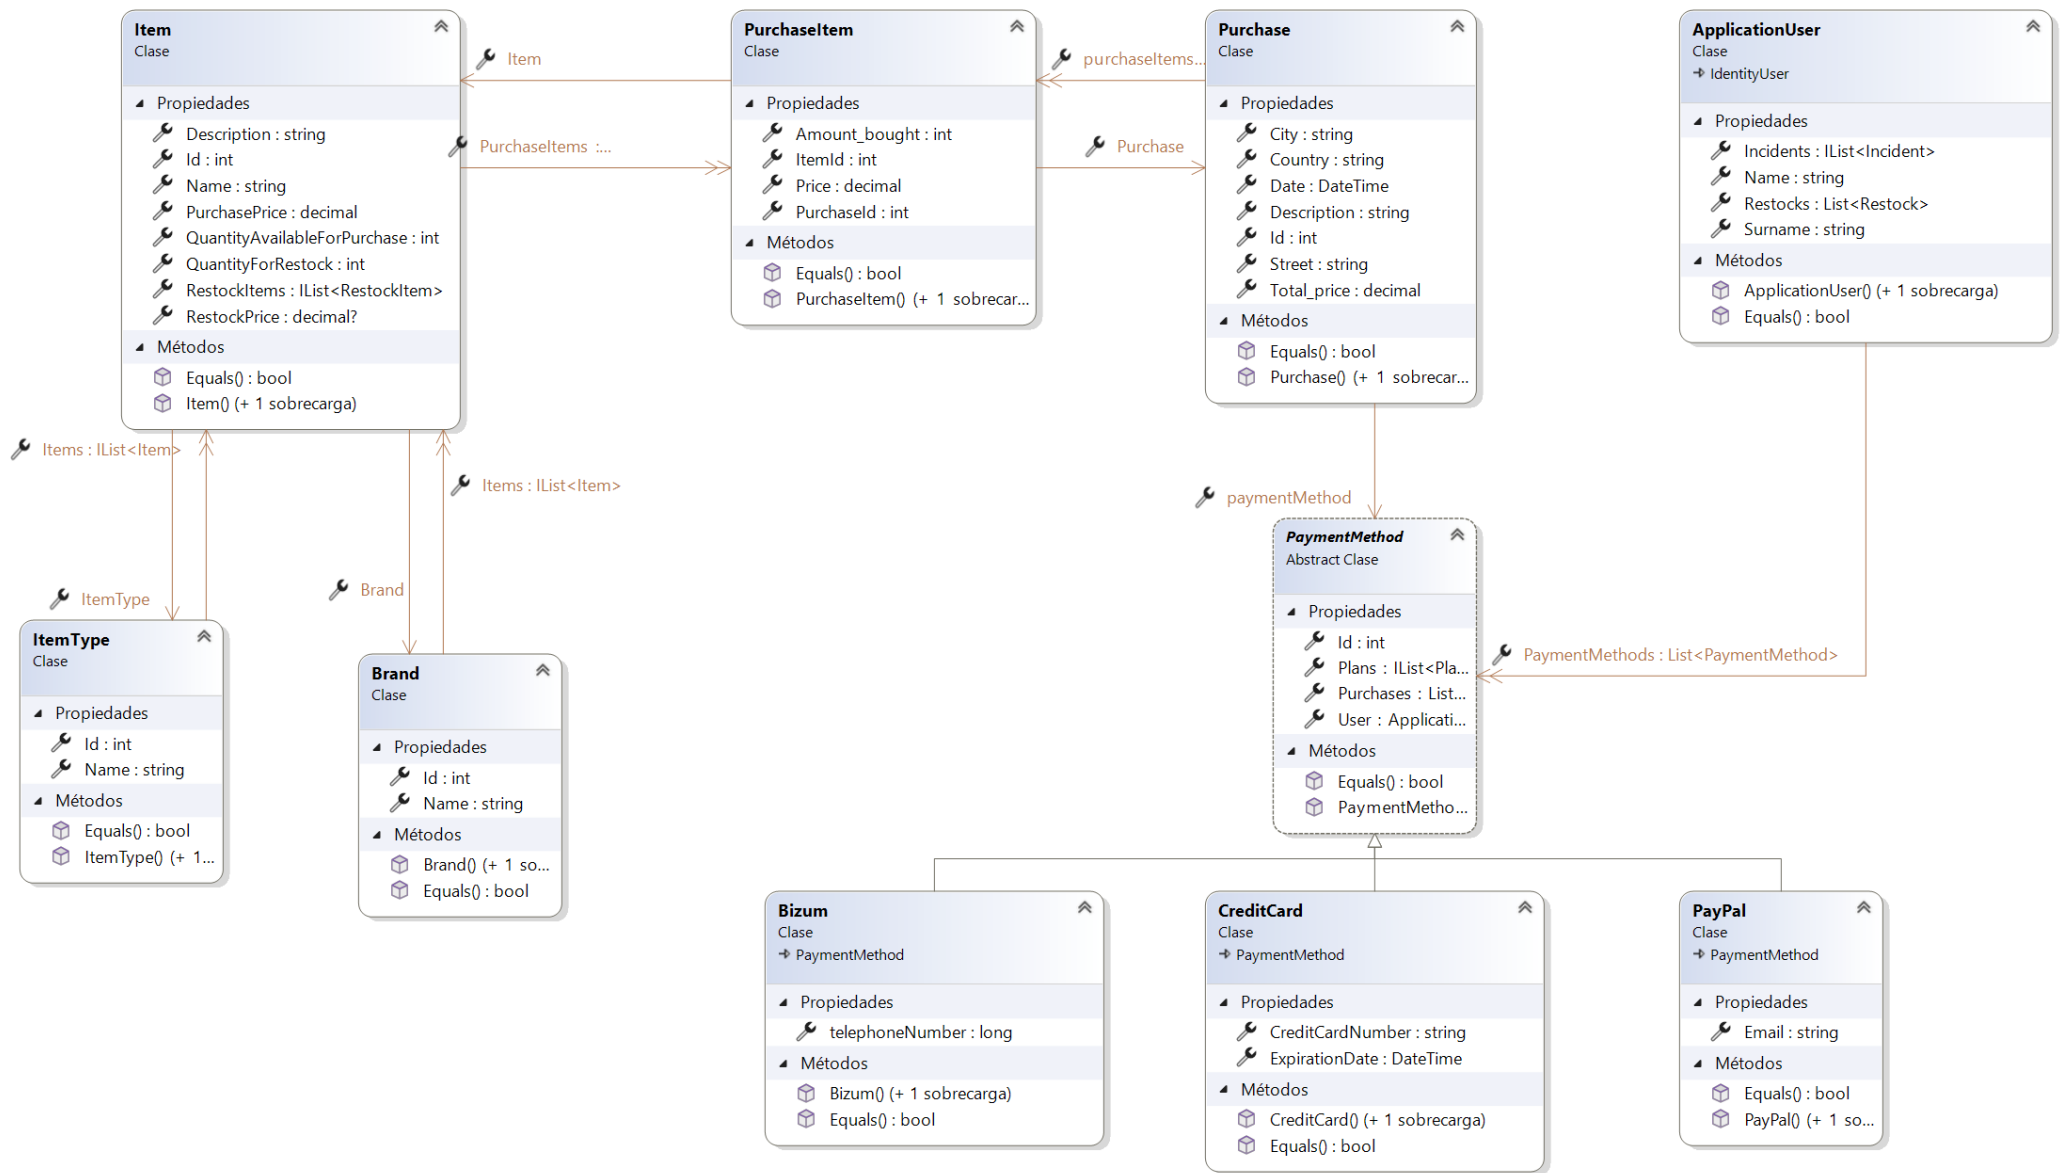

The system detects that the user has not filled mandatory information to properly make the purchase (such as the payment details mentioned above) and notifies an error to the user and go back to step 4.

Alternative flow 5 - to step 7

If the system detects that the quantity the user has selected for a specific item is greater than the quantity_available for that item, it will notify an error to the user and go back to step 4.

Pre-condition

The ApplicationUser is logged-in with role User.

Use Case: Create Restock of Items

Main Flow

1. The administrator selects Restock from the main menu.
2. The system shows the list of items available for restock, indicating **name, brand, quantity in stock and price of restock**.
3. The administrator selects the item or items to be restocked and clicks next.
4. The system shows the items selected indicating their **name, brand, quantity, price of restock** and requests the administrator to input the **quantity** of each of them (mandatory) to be bought, **title and delivery address** (mandatory) and an optional **description** and expected **date** for the restock.
5. The administrator fills in such data and chooses the Save option.
6. The system shows the **administrator's** data (**Name and Surname**), total price of the restock if all the items have restockprice as well as the items restocked (**name, brand, price, and quantity**), title of the restock, delivery address, description and expected date (if optional data is used regarding date and description).

Alternative flow 1 - to step 2

If the system detects that there are no items available for restock because of their quantity available for purchase is higher than the quantity for restock, it will warn the administrator.

Alternative flow 1 - to step 2

2.1 The system offers the administrator the alternative to filter the items according to their name and/or quantity available for purchase.

2.2 The administrator selects those filters he is interested in.

2.3 The system shows those items that satisfied only the selected filters.

Alternative flow 3 - to step 4

If the system detects there are not items in the restock cart, the restock option to continue the process won't be available until at least 1 item is selected.

Alternative flow 4 - to step 6

If the system detects that any mandatory data have not been filled, the system will notify it to the administrator and return to step 5.

Alternative flow 5 - to step 6

The administrator selects to modify the selected items returning to step 2.

Pre-condition

The ApplicationUser is logged in the system with role Administrator to start the use case.
